

A simple model of the Monetary Circuit

Functions to derive a system of coupled Ordinary Differential Equations

```
System(x) :=
  Functions ← submatrix(x, 2, 2, 1, cols(x) - 1)
  Equations ← submatrix(x, 3, rows(x) - 1, 1, cols(x) - 1)
  for i ∈ 0 .. cols(Functions) - 1
    Ei ←  $\frac{d}{dt}$  Functionsi =  $\sum$  Equationsi,j
  return E
```

```
Vars(x) :=
  varsraw ← submatrix(x, 2, 2, 1, cols(x) - 1)
  vars ← varsrawT
  return vars
```

```
Audit(x) :=
  Equations ← submatrix(x, 3, rows(x) - 1, 1, cols(x) - 1)
  for i ∈ 0 .. rows(Equations) - 1
    Sumi ←  $\sum_{j=0}^{cols(Equations)-1}$  Equationsi,j
  return Sum
```

Basic Flow Table

$$S_1 := \begin{pmatrix} \begin{array}{l} \text{"Type"} \\ \text{"Name"} \\ \text{"Symbol"} \\ \text{"Loan Transactions"} \\ \text{"Deposit Interest Firms"} \\ \text{"Wages"} \\ \text{"Deposit Interest Workers"} \\ \text{"Consumption"} \end{array} & \begin{array}{ccccc} 1 & -1 & -1 & 0 \\ \text{"Firm Loan"} & \text{"Firm Deposit"} & \text{"Worker Deposit"} & \text{"Bank Income"} \\ \mathbf{F_L}(t) & F_D(t) & W_D(t) & B_I(t) \\ A - A & -A & 0 & A \\ 0 & B & 0 & -B \\ 0 & -C & C & 0 \\ 0 & 0 & D & -D \\ 0 & E + F & -E & -F \end{array} \end{pmatrix}$$

$$\text{Audit}(S_1) \rightarrow \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

Symbolic substitutions for alphabetic placeholders

$$A := r_L \cdot F_L(t) \quad B := r_D \cdot F_D(t) \quad C := w \cdot F_D(t) \quad D := r_D \cdot W_D(t) \quad E := \omega \cdot W_D(t) \quad F := \beta \cdot B_I(t)$$

$$S_1 := \left(\begin{array}{l|ccccc} \text{"Type"} & 1 & -1 & -1 & 0 \\ \text{"Name"} & \text{"Firm Loan"} & \text{"Firm Deposit"} & \text{"Worker Deposit"} & \text{"Bank Income"} \\ \text{"Symbol"} & F_L(t) & F_D(t) & W_D(t) & B_I(t) \\ \text{"Loan Transactions"} & A - A & -A & 0 & A \\ \text{"Deposit Interest Firms"} & 0 & B & 0 & -B \\ \text{"Wages"} & 0 & -C & C & 0 \\ \text{"Deposit Interest Workers"} & 0 & 0 & D & -D \\ \text{"Consumption"} & 0 & E + F & -E & -F \end{array} \right)$$

Resulting system of ODEs

$$\text{System}(S_1) \rightarrow \left(\begin{array}{l} \frac{d}{dt} F_L(t) = 0 \\ \frac{d}{dt} F_D(t) = \beta \cdot B_I(t) + r_D \cdot F_D(t) - r_L \cdot F_L(t) + \omega \cdot W_D(t) - w \cdot F_D(t) \\ \frac{d}{dt} W_D(t) = w \cdot F_D(t) - \omega \cdot W_D(t) + r_D \cdot W_D(t) \\ \frac{d}{dt} B_I(t) = r_L \cdot F_L(t) - r_D \cdot F_D(t) - \beta \cdot B_I(t) - r_D \cdot W_D(t) \end{array} \right)$$

Derivation of equilibrium conditions

Given

$$F_L = \Lambda$$

$$0 = \beta \cdot B_I + r_D \cdot F_D - r_L \cdot F_L + \omega \cdot W_D - w \cdot F_D$$

$$0 = w \cdot F_D - \omega \cdot W_D + r_D \cdot W_D$$

$$0 = r_L \cdot F_L - r_D \cdot F_D - \beta \cdot B_I - r_D \cdot W_D$$

$$F_D + W_D + B_I = F_L$$

$$\begin{pmatrix} F_{L_eq} \\ F_{D_eq} \\ W_{D_eq} \\ B_{I_eq} \end{pmatrix} := \text{Find} \left(\begin{pmatrix} F_L \\ F_D \\ W_D \\ B_I \end{pmatrix} \right) \left| \begin{array}{l} \text{simplify} \\ \text{collect, } \Lambda \end{array} \right. \rightarrow \begin{bmatrix} \Lambda \\ \frac{(\beta - r_L) \cdot (\omega - r_D)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda \\ \frac{w \cdot (\beta - r_L)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda \\ \left(-\frac{r_D - r_L}{\beta - r_D} \right) \cdot \Lambda \end{bmatrix}$$

Rewriting w in terms of rate of surplus s and rate of turnover τ_S .

$$\begin{bmatrix} \Lambda \\ \frac{(\beta - r_L) \cdot (\omega - r_D)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda \\ \frac{w \cdot (\beta - r_L)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda \\ \left(-\frac{r_D - r_L}{\beta - r_D} \right) \cdot \Lambda \end{bmatrix} \left| \begin{array}{l} \text{substitute, } w = \frac{1-s}{\tau_S} \\ \text{simplify} \end{array} \right. \rightarrow \begin{bmatrix} \Lambda \\ \frac{\Lambda \cdot \tau_S \cdot (\beta - r_L) \cdot (\omega - r_D)}{(\beta - r_D) \cdot (s - \omega \cdot \tau_S + r_D \cdot \tau_S - 1)} \\ \frac{\Lambda \cdot (\beta - r_L) \cdot (s - 1)}{(\beta - r_D) \cdot (s - \omega \cdot \tau_S + r_D \cdot \tau_S - 1)} \\ -\frac{\Lambda \cdot (r_D - r_L)}{\beta - r_D} \end{bmatrix}$$

Showing equilibrium bank account balances as a function of key parameters

$$\beta := 1 \quad \omega := 26 \quad r_L := 5\% \quad r_D := 1\% \quad \Lambda := 100 \quad w := 4$$

$$F_{Le}(\beta, \omega, w) := \Lambda$$

$$F_{De}(\beta, \omega, w) := \frac{(\beta - r_L) \cdot (\omega - r_D)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda$$

$$W_{De}(\beta, \omega, w) := \frac{w \cdot (\beta - r_L)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda$$

$$B_{Ie}(\beta, \omega, w) := \left(-\frac{r_D - r_L}{\beta - r_D} \right) \cdot \Lambda$$

Account Balances as a function of β

Account Balances as a function of ω

Equilibrium account values given parameter values

$$\begin{pmatrix} \beta \\ \varepsilon \\ r_L \\ r_D \\ w \\ \Lambda \end{pmatrix} = \begin{pmatrix} 1 \\ 26 \\ 0.05 \\ 0.01 \\ 4 \\ 100 \end{pmatrix} \quad \begin{bmatrix} \Lambda \\ \frac{(\beta - r_L) \cdot (\omega - r_D)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda \\ \frac{w \cdot (\beta - r_L)}{(\beta - r_D) \cdot (\omega - r_D + w)} \cdot \Lambda \\ \left(\frac{r_D - r_L}{\beta - r_D} \right) \cdot \Lambda \end{bmatrix} = \begin{pmatrix} 100 \\ 83.161 \\ 12.799 \\ 4.04 \end{pmatrix}$$

Equilibrium incomes as a function of parameter values

$$\text{Wages}(\beta, \omega, w) := w \cdot F_{De}(\beta, \omega, w)$$

Rewriting w as $w = \frac{1-s}{\tau_S}$

$$\underline{w} := 30\% \quad \tau_S := \frac{1}{4}$$

Account balances using this substitution

$$F_{Le2}(\beta, \omega, s, \tau_S) := \Lambda$$

$$F_{De2}(\beta, \omega, s, \tau_S) := -\frac{\Lambda \cdot \tau_S \cdot (\beta - r_L) \cdot (\omega - r_D)}{(\beta - r_D) \cdot (s - \omega \cdot \tau_S + r_D \cdot \tau_S - 1)}$$

$$W_{De2}(\beta, \omega, s, \tau_S) := \frac{\Lambda \cdot (\beta - r_L) \cdot (s - 1)}{(\beta - r_D) \cdot (s - \omega \cdot \tau_S + r_D \cdot \tau_S - 1)}$$

$$B_{Ie2}(\beta, \omega, s, \tau_S) := -\frac{\Lambda \cdot (r_D - r_L)}{\beta - r_D}$$

Equilibrium wages and profits using this substitution

$$Wages_2(\beta, w, s, \tau_S) := \frac{1-s}{\tau_S} \cdot F_{De2}(\beta, \omega, s, \tau_S)$$

$$Profits_2(\beta, w, s, \tau_S) := \frac{s}{\tau_S} \cdot F_{De2}(\beta, \omega, s, \tau_S)$$

Equilibrium class incomes including interest transfers

$$\text{Workers}(\beta, \omega, s, \tau_S) := \text{Wages}_2(\beta, \omega, s, \tau_S) + r_D \cdot W_{De2}(\beta, \omega, s, \tau_S)$$

$$\text{Capitalists}(\beta, \omega, s, \tau_S) := \text{Profits}_2(\beta, \omega, s, \tau_S) - r_L \cdot \Lambda + r_D \cdot F_{De2}(\beta, \omega, s, \tau_S)$$

$$\text{Bankers}(\beta, \omega, s, \tau_S) := r_L \cdot \Lambda - r_D \cdot (F_{De2}(\beta, \omega, s, \tau_S) + W_{De2}(\beta, \omega, s, \tau_S))$$

Class incomes as functions of τ_S

τ_S from 0 to 10 (given $\beta=1, \omega=26, s=0.3$)

	Deposit Accounts	Gross Incomes	Net Incomes
Capitalists	$F_{De2}(\beta, \omega, s, \tau_S) = 86.627$	$Profits_2(\beta, \omega, s, \tau_S) = 103.952$	$Capitalists(\beta, \omega, s, \tau_S) = 99.819$
Workers	$W_{De2}(\beta, \omega, s, \tau_S) = 9.333$	$Wages_2(\beta, \omega, s, \tau_S) = 242.555$	$Workers(\beta, \omega, s, \tau_S) = 242.649$
Bankers	$B_{Ie2}(\beta, \omega, s, \tau_S) = 4.04$	$r_L \cdot \Lambda = 5$	$Bankers(\beta, \omega, s, \tau_S) = 4.04$

Dynamic simulation of the model

$$s := s \quad \tau_S := \tau_S \quad C := \frac{1-s}{\tau_S} \cdot F_D(t)$$

$$S_1 := \left(\begin{array}{l} \text{"Type"} \\ \text{"Name"} \\ \text{"Symbol"} \\ \text{"Loan Transactions"} \\ \text{"Deposit Interest"} \\ \text{"Wages"} \\ \text{"Deposit Interest"} \\ \text{"Consumption"} \end{array} \begin{array}{cccc} 1 & -1 & -1 & 0 \\ \text{"Firm Loan"} & \text{"Firm Deposit"} & \text{"Worker Deposit"} & \text{"Bank Income"} \\ F_L(t) & F_D(t) & W_D(t) & B_I(t) \\ A - A & -A & 0 & A \\ 0 & B & 0 & -B \\ 0 & -C & C & 0 \\ 0 & 0 & D & -D \\ 0 & E + F & -E & -F \end{array} \right)$$

$$\text{System}(S_1) \rightarrow \left[\begin{array}{l} \frac{d}{dt} F_L(t) = 0 \\ \frac{d}{dt} F_D(t) = \beta \cdot B_I(t) + r_D \cdot F_D(t) - r_L \cdot F_L(t) + \omega \cdot W_D(t) + \frac{F_D(t) \cdot (s-1)}{\tau_S} \\ \frac{d}{dt} W_D(t) = r_D \cdot W_D(t) - \omega \cdot W_D(t) - \frac{F_D(t) \cdot (s-1)}{\tau_S} \\ \frac{d}{dt} B_I(t) = r_L \cdot F_L(t) - r_D \cdot F_D(t) - \beta \cdot B_I(t) - r_D \cdot W_D(t) \end{array} \right]$$

$$\beta := 1 \quad \omega := 26 \quad r_L := 5\% \quad r_D := 1\% \quad \Lambda := 100 \quad \text{Years} := 10$$

Given

$$\frac{d}{dt} F_L(t) = 0 \quad F_L(0) = \Lambda$$

$$\frac{d}{dt} F_D(t) = \beta \cdot B_I(t) + r_D \cdot F_D(t) - r_L \cdot F_L(t) + \omega \cdot W_D(t) + \frac{F_D(t) \cdot (s-1)}{\tau_S} \quad F_D(0) = \Lambda$$

$$\frac{d}{dt} W_D(t) = r_D \cdot W_D(t) - \omega \cdot W_D(t) - \frac{F_D(t) \cdot (s-1)}{\tau_S} \quad W_D(0) = 0$$

$$\frac{d}{dt} B_I(t) = r_L \cdot F_L(t) - r_D \cdot F_D(t) - \beta \cdot B_I(t) - r_D \cdot W_D(t) \quad B_I(0) = 0$$

$$\begin{pmatrix} F_L \\ F_D \\ W_D \\ B_I \end{pmatrix} := \text{Odesolve} \left[\begin{pmatrix} F_L \\ F_D \\ W_D \\ B_I \end{pmatrix}, t, \text{Years} \right]$$

Bank Balances

$$\text{Wages}(t) := \frac{1-s}{\tau_S} \cdot F_D(t)$$

$$\text{Workers}(t) := \text{Wages}(t) + r_D \cdot W_D(t)$$

$$\text{Profits}(t) := \frac{s}{\tau_S} \cdot F_D(t)$$

$$\text{Capitalists}(t) := \text{Profits}(t) + r_D \cdot F_D(t) - r_L \cdot F_L(t)$$

$$\text{Interest}(t) := r_L \cdot F_L(t)$$

$$\text{Bankers}(t) := \text{Interest}(t) - r_D \cdot (F_D(t) + W_D(t))$$
